

Held-out performance before and after removing the training-data caps

Shaded band marks the run-to-run variation of an independent retraining, taken as 0.005 for the first two panels and as the 0.0063 non-monotonicity measured on the enhancer curve for the third. A gain lying inside the band is not established by this comparison alone. The generator measures a different quantity with no repeat-run estimate, so it carries no band.
